

Abstract:

The inventive application describes a process for  
producing self-cleaning surfaces by means of a dry  
5 coating process.

The process of the invention produces self-cleaning  
surfaces which have elevations formed by particles  
applied dry to the surface by means of a modified  
10 flame-spraying process.

The process of the invention can equip textiles and  
other articles, in particular those having plastic  
surfaces, with self-cleaning properties.
